

Apr 24, 2012 - Gridlogics launches web based patent research platform PatSeer

Worlds first independent cross-functional collaboration and research delivery platform promotes patent data sharing and helps companies avoid getting tied into proprietary platforms

Gridlogics, a global leader in patent analytic solutions, announced today the launch of PatSeer™ - a Web 2.0 patent research platform that is poised to change how patent professionals collaborate on patent projects with internal and external stakeholders. Being an independent platform, companies can now manage patent projects across multiple teams and service providers without being locked into any one source.

PatSeer includes a global patent database comprising 60 million plus records along with many calculated fields for superior research. It has multiple patent industry firsts, such, as capability to share the platform itself instead of sharing a folder of records, capability to setup and securely share multiple dashboards highlighting different facets of a project and a unique pay-per-project model that drastically reduces project collaboration and content sharing costs. With an extremely intuitive interface, large teams can begin collaborating on PatSeer almost instantly.

“Today’s patent projects involve geographically dispersed R&D teams, multiple counsels, open-innovation partners and external service providers. The challenge is no longer restricted to data, and is more about how to communicate it, manage collaboration, access rights, project workflows and metadata.” said Manish Sinha, Chief Technology Officer, Gridlogics. “Patent professionals have grown from being search providers to being intelligence partners and so they require a platform that enables continuous engagement, secure collaboration and flexible on-the-fly analysis.”

With powerful features such as command line search, multi-level categories, unlimited custom fields, highly configurable access rights and multi-dashboard provisioning, projects in PatSeer have been designed to meet the needs of most demanding users from day one.
